

L Annotation Guideline for Community Terminology Metadata

Assumption:

- Annotators are fluent, college-educated readers but are not assumed to know the target gaming or cybersecurity community. Example: a general reader may know “ticket” but not the security sense of “golden ticket.”
- Annotate the expression in its cited context, not from the surface form alone. Example: record “stat stick” as used in Warframe, not as an ordinary stick with statistics.

TL;DR:

- ❖ **[Domain]** Choose Cybersecurity or Gaming from the source community. Example: “Pass the hash” → Cybersecurity.
- ❖ **[Term]** Copy the smallest complete community-specific expression exactly. Example: Keep “pass the hash,” not only “hash.”
- ❖ **[Linguistic construction]** Assign one primary surface-formation label from Table 1. Example: “golden ticket” → Metaphor.
- ❖ **[Community / sub-community]** Record broad community first, then the narrow context. Example: Red Team / Windows Credential Abuse.
- ❖ **[Real usage example]** Copy a natural sentence that uses the expression without directly defining it. Example: “Every time I hold an angle I always get one tapped...”
- ❖ **[Source link]** Save the direct page or thread URL containing the quoted sentence. Example: A Reddit thread URL, not a Google results page.
- ❖ **[Verification record]** Save the Google query, displayed result-count text, retrieval date, translation check, Gemini check, and keep/exclude decision. Example: Query “nlp”; display “About 66,900,000 results (0.29s)”; date YYYY-MM-DD.

Steps for Finding and Verifying Terms:

1. **Collect source communities:** Create a source list of forums, subreddits, Steam discussions, wikis, Discord archives, documentation, and specialist boards. Record platform, community, URL, and access date. Example: Steam Community for a game mechanic; r/AskNetsec for Windows credential abuse.
2. **Read and spot candidates:** Read threads rather than keyword lists. Mark expressions that are opaque, shifted, abbreviated, coded, or conventionalized within the community. Save the full sentence immediately. Example: Mark “stat stick” in a Warframe discussion; do not separately collect the generic word “weapon.”
3. **Verify with Google Search:** Search the quoted expression with its community. Record the exact query, the tools-bar result-count display, retrieval date, and whether relevant community evidence appears. Example: Query: “stat stick” Warframe. Count format example: “About 66,900,000 results (0.29s).” Counts are approximate and may change.
4. **Check translation when relevant:** For non-English, borrowed, or code-mixed items, record source language, target language, and Google Translate output verbatim. Translation is a diagnostic check, not final evidence. Example: For “kaizo ironmon,” record whether translation preserves the community expression or produces an unhelpful literal rendering.
5. **Check Gemini interpretation:** Provide the exact term, usage sentence, and community; save the prompt, model/date, and response verbatim. Use the response to identify ambiguity or likely model failure, not as the gold source. Example: Ask: “In this Warframe sentence, what does stat stick mean? Explain only from the provided context and state uncertainty.”
6. **Keep or exclude:** Keep only expressions supported by authentic community use and a stable context-specific sense. Record a short decision reason. Example: Keep “OOB” in speedrunning; exclude “game” because it is general and has no specialized shifted sense.

How Each Metadata Field Is Annotated:

- ❖ **[Term]** Select the narrowest complete span; preserve capitalization, punctuation, numerals, and spelling. Example: ret2libc, Any%, LoLBins.
- ❖ **[Linguistic construction]** Choose the label that best explains the recorded form. If two labels are equally plausible, select one and flag the row for review. Example: Fashionframe → Blending, not simply Compound.
- ❖ **[Community / sub-community]** Infer from the source and thread topic, then standardize as “Broad community / specific context.” Example: Gaming / Warframe Build Optimization.
- ❖ **[Real usage example]** Use one complete, natural sentence with enough local context. Keep original wording and mark omissions with ellipses. Example: Prefer “Can MitM attack be avoided...?” over “MITM means man-in-the-middle.”
- ❖ **[Source link]** Open and confirm the quote. Record the direct stable URL and access date. Example: Direct thread URL; avoid screenshots without a retrievable page.
- ❖ **[Google evidence]** Copy the exact query and displayed result-count text; note whether top results are context-relevant. Example: A large count for “nlp” shows broad retrieval, but does not prove community specificity.
- ❖ **[Translation / Gemini evidence]** Store outputs verbatim in separate fields and label the tool, language/model, and date. Example: Do not rewrite a weak answer into a correct answer.
- ❖ **[Decision]** Assign Keep, Exclude, or Review and provide one observable reason. Example: Review when the term appears only once or communities use conflicting senses.

General Principles:

- Community evidence outranks surface intuition. Example: “blueberries” in Destiny should be judged from Destiny usage, not the fruit sense.
- Result counts are retrieval metadata, not a popularity score. They vary by time, location, personalization, spelling, and query formulation.
- Google Translate and Gemini are verification tools, not authoritative sources. Preserve their outputs so future analysis can measure errors.
- Novelty alone is insufficient. Keep a term because it has a stable community-specific sense, not merely because it is rare or unfamiliar.

Keep in mind:

Keep	Avoid
• Authentic, community-grounded expressions (e.g., “pass the hash”). • Natural usage requiring interpretation (e.g., “one tapped”). • Direct source URLs and verbatim tool outputs. • A documented reason for every Keep/Exclude/Review decision.	• General words with no shifted sense (e.g., “weapon”). • Sentences that directly define the term. • AI-generated or paraphrased quotations. • Treating Google result counts as stable prevalence estimates.

Linguistic Construction Categories

Category	How to identify	Example	Real usage context
Abbreviation	Compressed written form using letters, numerals, or symbols rather than a full phrase.	<i>ret2libc</i>	"Even if the NX bit is not set it's probably easier to use ret2libc in these cases."
Acronym	Initial letters pronounced or used as a single lexical item.	<i>TOCTOU</i>	"Not all uses of access(2) lead to TOCTOU vulnerabilities."
Affixation	A base form gains a prefix or suffix that creates the community term.	<i>twinking</i>	"Back in my day, twinkling had communities for each bracket."
Blending	Parts of two or more words are fused into one form.	<i>Fashionframe</i>	"Do you ever see someone else's Warframe and say 'that's awesome'?... You'd love Fashionframe."
Borrowing	A form is imported from another language or established cultural register.	<i>kaizo ironmon</i>	"One of the streamers I watch... did a Pokémon challenge run... called 'kaizo ironmon'."
Clipping	A longer word or phrase is shortened while retaining its community meaning.	<i>uptime strat</i>	"M10S Flame Floater Uptime strat."
Code Word	An ordinary-looking expression conventionally masks or indirectly names a specialized practice.	<i>evil maid</i>	"I've done what I know to protect my work laptop from an evil maid attack."
Community-specific Jargon	A conventional community label not adequately captured by another formation process.	<i>Any%</i>	"...pretty much any game with an ACE credits warp usually has Any% be less popular."
Compound	Two or more complete lexical units combine into one specialized term.	<i>MFA fatigue</i>	"MFA fatigue attacks are getting out of control—time to rethink our authentication strategy?"
Functional Shift	An existing form changes grammatical function in community use.	<i>one tapped</i>	"Every time I hold an angle I always get one tapped..."
Initialism	Initial letters are normally read letter by letter.	<i>MITM</i>	"Can MitM attack be avoided without using a 3rd party?"
Meme Expression	A phrase is conventionalized through recurring online humor or meme circulation.	<i>boomer shooter</i>	"Had they made it a total 'boomer shooter' I doubt it would have sold as well."
Metaphor	A familiar expression is transferred figuratively to a specialized community concept.	<i>golden ticket</i>	"...if you suspect possible golden ticket exploit, if you clear all Active sessions..."
Multiword Expression	A fixed phrase functions as one conventionalized community unit.	<i>wall-to-wall pull</i>	"Is it possible to heal a wall to wall pull in Stone Vigil...?"
Semantic Shift	An existing word keeps its form but acquires a distinct community-specific sense.	<i>blueberries</i>	"We got the blueberries their first Vow clear—and their first-ever raid clear."

Table 1: Linguistic construction labels used in the dataset. Examples reproduce authentic usage context; they are not gold definitions.
